Q1. Void Function (No Return Value)

CODE

```
def display_message():
    print("Welcome to Python Programming")
display_message()
```

OUTPUT

Welcome to Python Programming

Q2. Void Function (No Return Value)

CODE

```
def print_table(n):
    for i in range(1, 11):
        print(f"{n} x {i} = {n * i}")
num = int(input())
print_table(num)
```

INPUT

6

OUTPUT

Q3. Void Function (No Return Value)

CODE

```
def print_even_numbers(n):
    for i in range(2, n + 1, 2):
        print(i)
num = int(input())
print_even_numbers(num)
```

INPUT

68

OUTPUT

Q4. Fruitful Function (Returns One Value)

CODE

```
def count_vowels(s):
    vowels = "aeiouAEIOU"
    count = 0
    for char in s:
        if char in vowels:
            count += 1
    return count
text = input()
print(count_vowels(text))
```

INPUT

yashini

OUTPUT

CODE

```
def find_largest(numbers):  
    return max(numbers)  
nums = list(map(int, input().split()))  
print(find_largest(nums))
```

INPUT

10 45 2 91 58

OUTPUT

Q6. Fruitful Function (Returns One Value)

CODE

```
def is_palindrome(s):  
    return s == s[::-1]  
text = input()  
print(is_palindrome(text))
```

OUTPUT

Q7. Function Returning Two or More Values

CODE

```
def calculate_results(n1, n2, n3):  
    total = n1 + n2 + n3  
    avg = total / 3  
    if avg >= 90:  
        grade = 'A'  
    elif avg >= 75:  
        grade = 'B'  
    elif avg >= 50:  
        grade = 'C'  
    else:  
        grade = 'F'  
  
    return total, avg, grade  
n1, n2, n3 = map(int, input().split())  
total, avg, grade = calculate_results(n1, n2, n3)  
print("Total:", total)  
print("Average:", avg)  
print("Grade:", grade)
```

INPUT

85 89 29

OUTPUT

Q8. Function Returning Two or More Values

CODE

```
import math  
def calculate_circle_properties(radius):  
    area = math.pi * radius ** 2  
    circumference = 2 * math.pi * radius  
    return area, circumference  
r = float(input())  
area, circumference = calculate_circle_properties(r)  
print("Area:", area)  
print("Circumference:", circumference)
```

INPUT

5

OUTPUT

7/29/26, 9:27 PM

Q9. Function Returning Two or More Values

CODE

```
import math
def calculate_powers(n):
    square = n ** 2
    cube = n ** 3
    square_root = math.sqrt(n)
    return square, cube, square_root
num = float(input())
sq, cb, sqrt_val = calculate_powers(num)
print("Square:", sq)
print("Cube:", cb)
print("Square Root:", sqrt_val)
```

INPUT

8

OUTPUT

Q10. Keyword Arguments

CODE

```
def student(name, age, department):
    print(f"Name: {name}")
    print(f"Age: {age}")
    print(f"Department: {department}")
student(name="Alice", age=28, department="Computer Science")
```

OUTPUT

Q11. Keyword Arguments

CODE

```
def employee(empid, name, salary):
    print(f"Emp ID: {empid}")
    print(f"Name: {name}")
    print(f"Salary: {salary}")
employee(salary=50000, empid=101, name="John")
```

OUTPUT

Q12. Keyword Arguments

CODE

```
def book(title, author, price):
    print(f"Title: {title}")
    print(f"Author: {author}")
    print(f"Price: {price}")
book(title="Python Programming", author="Guido van Rossum", price=450)
```

OUTPUT

Q13. Variable-Length Arguments (*args)

CODE

```
def sum_all(*args):
    return sum(args)
numbers = list(map(int, input().split()))
print(sum_all(*numbers))
```
